We live in a time when the Internet is saturated with web-based content. There's more text than images, more pictures than video, and more text than pictures and video combined. It's safe to say that 95 percent of the world's web traffic is image-based. Although images are an essential part of visual communication, there are distinct disadvantages to relying on images as the sole means of conveying meaning. Why are Images Important? From the images, we learn the meaning of the text. Images are an essential part of visual communication. People in different cultures look at the same things, but the images they see are different. For example, the faces of people around the world are familiar yet can still be seen as distinct. There's even a few written words in most languages that distinguish even the native speakers. A picture is worth a thousand words. However, there's a limit to the number of words we can write in a picture. A picture without words is worth thousands of words. In the digital world, a picture is worth a million words. Here's an example: In the above picture, what is the best way to communicate the meaning of the diagram? The first way to understand the diagram is to read the text. If you read the text and understood it, you can easily draw the diagram on your own. The second way to understand the diagram is to listen to the audio. The audio is shown above. The third way to understand the diagram is to watch a video. The fourth way is to read both the text and the audio, then, read the text again. The fifth way to understand the diagram is to look at the picture. The sixth way is to use the picture. You can copy and paste the picture, then place it on a blank page. Or, you can write and print words, and place the words and the picture together on paper. When you look at the picture above, you can ask yourself what is the diagram. You can look at the picture, and draw the diagram on paper. Or, you can read the text, and write down the words. In fact, I prefer this last way. Although I don't believe in the Bible, but I believe in a kind of intelligence that exists in all of us. In the human world, I believe there's

[A new method for measuring glottis resistance in the long-term]. The pressure drop of the trachea in the small airways, measured during inspiration, is called the glottis resistance. The aim of this study was to determine the glottis resistance in normal subjects and patients with obstructive airways diseases by using a new method. The trachea is connected to a cannula placed in the glottis and the gas flow is measured. The glottis resistance is expressed as "cmH₂O/L/s". The new method is as follows: 1. Infusion of 500 mL saline with constant pressure at 8.7 cmH₂O. 2. Measurement of the flow. 3. Infusion of 500 mL saline with constant pressure at 15.6 cmH₂O. 4. Measurement of the flow. The tracheal cannula of normal subjects is 1.98 +/- 0.24 cmH₂O/L/s (mean +/- SD) at 8.7 cmH₂O and 1.41 +/- 0.33 cmH₂O/L/s (mean +/- SD) at 15.6 cmH₂O. The tracheal cannula of asthmatic patients is 2.06 +/- 0.39 cmH₂O/L/s at 8.7 cmH₂O and 1.82 +/- 0.41 cmH₂O/L/s at 15.6 cmH₂O. These results demonstrate that the new method is reliable. The method was applied to 11 normal subjects, 16 asthmatic patients and 8 patients with bronchomalacia. The results of these patients were compared with those of bronchial challenge tests. In 6 normal subjects, the glottis resistance increased as the inspiratory flow increased. In 10 asthmatic patients, it decreased as the inspiratory flow increased. In 4 patients with bronchomalacia, it increased. In these cases, the bronchial challenge test was considered positive. The glottis resistance at 15.6 cm
